## Lab 6: Chapter 4

1. A teacher decided to calculate z-scores for the scores (out of 100 points) on a test that students earned on an exam. The mean score on the exam was 84 points, and the standard deviation was 6.0 points. The teacher also calculated the z-scores for the points earned by students on homework assignments, which had a total of 250 points. The points earned on homework had a mean of 217 with a standard deviation of 9.8 points.

| Student | $\mathrm{x}=$ homework points | z -score for x | $\mathrm{y}=$ exam score | z -score for y |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 181 |  | 75 |  |
| 2 | 144 |  | 73 |  |
| 3 | 212 |  | 94 |  |

For each of the following pairs of variables in the next 3 exercises, identify which is likely to represent the independent ( x ) variable and which represents the dependent ( $y$ ) variable.
2. Variable 1: Days without smoking for a participant in a cessation program

Variable 2: Number of sessions attended by a smoker in a cessation program
3. Variable 1: Time spent by a student studying for a final exam

Variable 2: Score on the same final exam
4. Variable 1: Annual salary for a baseball player

Variable 2: Number of home runs hit per season by a baseball player

For each of the following pairs of variables, indicate whether you would expect a positive correlation, a negative correlation, or a correlation close to 0 . Explain your choice.
5. $\quad \mathrm{x}=$ daily hours of sunlight (in minutes)
$\mathrm{y}=$ daily growth of plants (in mm )
6. $\mathrm{x}=$ number of wolves per square mile
$y=$ number of elks per square mile
7. $\mathrm{x}=$ height of a student in high school
$\mathrm{y}=$ grade point average for a student in high school
8. Interest rate and number of loan applications
9. Height and IQ
10. Height and shoe size
11. Minimum daily temperature and cooling cost

## For each of the lines below, identify values for the slope (b) and y-intercept (a).

12. $y=98.9+2.3 x$
13. $y=0.727+0.178 x$
14. $y=23+4 x$
15. Use the information in the table below to answer parts a through f . The ages (in years) of 10 men and their systolic blood pressures (in millimeters of mercury) are listed in the table.

| Age, $x$ | 16 | 25 | 39 | 45 | 49 | 64 | 70 | 29 | 57 | 22 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Systolic Blood Pressure, $y$ | 109 | 122 | 143 | 132 | 199 | 185 | 199 | 130 | 175 | 118 |

(a) What is the sample correlation coefficient, $r$ ?
(b) Describe the type of correlation
(c) Interpret the meaning of the correlation in the context of the data.
(d) Find the equation that represents the least squares regression line for the data.
(e) Use the regression equation to predict the value of $y$ for $x=42$.
(f) Use the regression equation to predict the blood pressure for a man aged 67.
(g) Use the regression equation to predict the blood pressure for a man aged 80.
16. Use the information in the table below to answer parts a through g . The square footages and sale prices (in thousands of dollars) of seven homes are shown in the table at the left. (Source: Howard Hanna)

| Square footage, x | 1924 | 1592 | 2413 | 2332 | 1552 | 1312 | 1278 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Sale price, y | 174.9 | 136.9 | 275.0 | 219.9 | 120.0 | 99.9 | 145.0 |

(a) What is the sample correlation coefficient, $r$ ?
(b) Describe the type of correlation
(c) Interpret the meaning of the correlation in the context of the data.
(d) Find the equation that represents the least squares regression line for the data.
(e) Use the regression equation to predict the home's sale price when the square footage is 1450 square feet.
(f) Use the regression equation to predict the home's sale price when the square footage is 2720 square feet.
(g) Use the regression equation to predict the home's sale price when the square footage is 2175 square feet.
